6.1 Guessing+Induction

First we need to get rid of the $\mathcal{O}$-notation in our recurrence:

$$T(n) \le \begin{cases} 2T(\lceil \frac{n}{2} \rceil) + cn & n \ge 2 \\ 0 & \text{otherwise} \end{cases}$$

Assume that instead we had

$$T(n) \le \begin{cases} 2T(\frac{n}{2}) + cn & n \ge 2 \\ 0 & \text{otherwise} \end{cases}$$

One way of solving such a recurrence is to guess a solution, and check that it is correct by plugging it in.

6.1 Guessing+Induction

Suppose we guess $T(n) \leq dn \log n$ for a constant d. Then

$$
\begin{aligned}
T(n) &\leq 2T\left(\frac{n}{2}\right) + cn \\
&\leq 2\left(d\frac{n}{2} \log \frac{n}{2}\right) + cn \\
&= dn(\log n - 1) + cn \\
&= dn \log n + (c - d)n \\
&\leq dn \log n
\end{aligned}
$$

if we choose $d \geq c$.

Formally one would make an induction proof, where the above is the induction step. The base case is usually trivial.

6.1 Guessing+Induction

$$T(n) \leq \begin{cases} 2T(\frac{n}{2}) + cn & n \geq 16 \\ b & \text{otw.} \end{cases}$$

Guess: $T(n) \leq dn \log n$.

Proof. (by induction)

- **base case** $(2 \leq n < 16)$: true if we choose $d \geq b$.

- **induction step** $2 \ldots n - 1 \to n$:

  Suppose statem. is true for $n' \in \{2, \ldots, n-1\}$, and $n \geq 16$.
  We prove it for n:

  $$\begin{aligned} T(n) &\leq 2T\left(\frac{n}{2}\right) + cn \\ &\leq 2\left(d\frac{n}{2}\log\frac{n}{2}\right) + cn \\ &= dn(\log n - 1) + cn \\ &= dn\log n + (c-d)n \\ &\leq dn\log n \end{aligned}$$

  - Note that this proves the statement for $n \in \mathbb{N}_{\geq 2}$, as the statement is wrong for $n = 1$.
  - The base case is usually omitted, as it is the same for different recurrences.

  Hence, statement is true if we choose $d \geq c$.

6.1 Guessing+Induction

Why did we change the recurrence by getting rid of the ceiling?

If we do not do this we instead consider the following recurrence:

$$T(n) \leq \begin{cases} 2T(\lceil \frac{n}{2} \rceil) + cn & n \geq 16 \\ b & \text{otherwise} \end{cases}$$

Note that we can do this as for constant-sized inputs the running time is always some constant (b in the above case).

6.1 Guessing+Induction

We also make a guess of $T(n) \leq dn \log n$ and get

$$T(n) \leq 2T\left(\left\lceil \frac{n}{2} \right\rceil\right) + cn$$

$$\leq 2\left(d\left\lceil \frac{n}{2} \right\rceil \log \left\lceil \frac{n}{2} \right\rceil\right) + cn$$

$\boxed{\left\lceil \frac{n}{2} \right\rceil \leq \frac{n}{2} + 1}$ $\quad \leq 2(d(n/2 + 1)\log(n/2 + 1)) + cn$

$\boxed{\frac{n}{2} + 1 \leq \frac{9}{16}n}$ $\quad \leq dn \log \left(\frac{9}{16}n\right) + 2d \log n + cn$

$\boxed{\log \frac{9}{16}n = \log n + (\log 9 - 4)}$ $\quad = dn \log n + (\log 9 - 4)dn + 2d \log n + cn$

$\boxed{\log n \leq \frac{n}{4}}$ $\quad \leq dn \log n + (\log 9 - 3.5)dn + cn$

$$\leq dn \log n - 0.33dn + cn$$

$$\leq dn \log n$$

for a suitable choice of d.
