

## Can we do better?

In the following we show how to obtain a solution where the number of bins is only

$$\text{OPT}(I) + \mathcal{O}(\log^2(\text{SIZE}(I))) .$$

Note that this is usually better than a guarantee of

$$(1 + \epsilon)\text{OPT}(I) + 1 .$$

## Change of Notation:

- ▶ Group pieces of identical size.
- ▶ Let  $s_1$  denote the largest size, and let  $b_1$  denote the number of pieces of size  $s_1$ .
- ▶  $s_2$  is second largest size and  $b_2$  number of pieces of size  $s_2$ ;
- ▶ ...
- ▶  $s_m$  smallest size and  $b_m$  number of pieces of size  $s_m$ .

## Configuration LP

A possible packing of a bin can be described by an  $m$ -tuple  $(t_1, \dots, t_m)$ , where  $t_i$  describes the number of pieces of size  $s_i$ . Clearly,

$$\sum_i t_i \cdot s_i \leq 1 .$$

We call a vector that fulfills the above constraint a **configuration**.

# Configuration LP

Let  $N$  be the number of configurations (**exponential**).

Let  $T_1, \dots, T_N$  be the sequence of all possible configurations (a configuration  $T_j$  has  $T_{ji}$  pieces of size  $s_i$ ).

$$\begin{array}{ll} \min & \sum_{j=1}^N x_j \\ \text{s.t.} & \forall i \in \{1 \dots m\} \quad \sum_{j=1}^N T_{ji} x_j \geq b_i \\ & \forall j \in \{1, \dots, N\} \quad x_j \geq 0 \\ & \forall j \in \{1, \dots, N\} \quad x_j \text{ integral} \end{array}$$

**How to solve this LP?**

later...

We can assume that each item has size at least  $1/\text{SIZE}(I)$ .

# Harmonic Grouping

- ▶ Sort items according to size (monotonically decreasing).
- ▶ Process items in this order; close the current group if size of items in the group is at least 2 (or larger). Then open new group.
- ▶ I.e.,  $G_1$  is the smallest cardinality set of largest items s.t. total size sums up to at least 2. Similarly, for  $G_2, \dots, G_{r-1}$ .
- ▶ Only the size of items in the last group  $G_r$  may sum up to less than 2.

# Harmonic Grouping

From the grouping we obtain instance  $I'$  as follows:

- ▶ Round all items in a group to the size of the largest group member.
- ▶ Delete all items from group  $G_1$  and  $G_r$ .
- ▶ For groups  $G_2, \dots, G_{r-1}$  delete  $n_i - n_{i-1}$  items.
- ▶ Observe that  $n_i \geq n_{i-1}$ .

## Lemma 10

The number of different sizes in  $I'$  is at most  $\text{SIZE}(I)/2$ .

- ▶ Each group that survives (recall that  $G_1$  and  $G_r$  are deleted) has total size at least 2.
- ▶ Hence, the number of surviving groups is at most  $\text{SIZE}(I)/2$ .
- ▶ All items in a group have the same size in  $I'$ .

## Lemma 11

The total size of deleted items is at most  $\mathcal{O}(\log(\text{SIZE}(I)))$ .

- ▶ The total size of items in  $G_1$  and  $G_r$  is at most 6 as a group has total size at most 3.
- ▶ Consider a group  $G_i$  that has strictly more items than  $G_{i-1}$ .
- ▶ It discards  $n_i - n_{i-1}$  pieces of total size at most

$$3 \frac{n_i - n_{i-1}}{n_i} \leq \sum_{j=n_{i-1}+1}^{n_i} \frac{3}{j}$$

since the smallest piece has size at most  $3/n_i$ .

- ▶ Summing over all  $i$  that have  $n_i > n_{i-1}$  gives a bound of at most

$$\sum_{j=1}^{n_{r-1}} \frac{3}{j} \leq \mathcal{O}(\log(\text{SIZE}(I))) .$$

(note that  $n_r \leq \text{SIZE}(I)$  since we assume that the size of each item is at least  $1/\text{SIZE}(I)$ ).

### Algorithm 1 BinPack

- 1: **if**  $\text{SIZE}(I) < 10$  **then**
- 2:     pack remaining items greedily
- 3: Apply harmonic grouping to create instance  $I'$ ; pack discarded items in at most  $\mathcal{O}(\log(\text{SIZE}(I)))$  bins.
- 4: Let  $x$  be optimal solution to configuration LP
- 5: Pack  $\lfloor x_j \rfloor$  bins in configuration  $T_j$  for all  $j$ ; call the packed instance  $I_1$ .
- 6: Let  $I_2$  be remaining pieces from  $I'$
- 7: Pack  $I_2$  via  $\text{BinPack}(I_2)$

$$\text{OPT}_{\text{LP}}(I_1) + \text{OPT}_{\text{LP}}(I_2) \leq \text{OPT}_{\text{LP}}(I') \leq \text{OPT}_{\text{LP}}(I)$$

## Proof:

- ▶ Each piece surviving in  $I'$  can be mapped to a piece in  $I$  of no lesser size. Hence,  $\text{OPT}_{\text{LP}}(I') \leq \text{OPT}_{\text{LP}}(I)$
- ▶  $\lfloor x_j \rfloor$  is feasible solution for  $I_1$  (even integral).
- ▶  $x_j - \lfloor x_j \rfloor$  is feasible solution for  $I_2$ .

# Analysis

Each level of the recursion partitions pieces into three types

1. Pieces discarded at this level.
2. Pieces scheduled because they are in  $I_1$ .
3. Pieces in  $I_2$  are handed down to the next level.

Pieces of type 2 summed over all recursion levels are packed into at most  $\text{OPT}_{\text{LP}}$  many bins.

Pieces of type 1 are packed into at most

$$\mathcal{O}(\log(\text{SIZE}(I))) \cdot L$$

many bins where  $L$  is the number of recursion levels.

# Analysis

We can show that  $\text{SIZE}(I_2) \leq \text{SIZE}(I)/2$ . Hence, the number of recursion levels is only  $\mathcal{O}(\log(\text{SIZE}(I_{\text{original}})))$  in total.

- ▶ The number of non-zero entries in the solution to the configuration LP for  $I'$  is at most the number of constraints, which is the number of different sizes ( $\leq \text{SIZE}(I)/2$ ).
- ▶ The total size of items in  $I_2$  can be at most  $\sum_{j=1}^N x_j - \lfloor x_j \rfloor$  which is at most the number of non-zero entries in the solution to the configuration LP.

## How to solve the LP?

Let  $T_1, \dots, T_N$  be the sequence of all possible configurations (a configuration  $T_j$  has  $T_{ji}$  pieces of size  $s_i$ ).

In total we have  $b_i$  pieces of size  $s_i$ .

### Primal

$$\begin{array}{ll} \min & \sum_{j=1}^N x_j \\ \text{s.t.} & \forall i \in \{1 \dots m\} \quad \sum_{j=1}^N T_{ji} x_j \geq b_i \\ & \forall j \in \{1, \dots, N\} \quad x_j \geq 0 \end{array}$$

### Dual

$$\begin{array}{ll} \max & \sum_{i=1}^m y_i b_i \\ \text{s.t.} & \forall j \in \{1, \dots, N\} \quad \sum_{i=1}^m T_{ji} y_i \leq 1 \\ & \forall i \in \{1, \dots, m\} \quad y_i \geq 0 \end{array}$$

## Separation Oracle

Suppose that I am given variable assignment  $\mathbf{y}$  for the dual.

**How do I find a violated constraint?**

I have to find a configuration  $T_j = (T_{j1}, \dots, T_{jm})$  that

- ▶ is feasible, i.e.,

$$\sum_{i=1}^m T_{ji} \cdot s_i \leq 1 ,$$

- ▶ and has a large profit

$$\sum_{i=1}^m T_{ji} \mathbf{y}_i > 1$$

But this is the Knapsack problem.

## Separation Oracle

We have FPTAS for Knapsack. This means if a constraint is violated with  $1 + \epsilon' = 1 + \frac{\epsilon}{1-\epsilon}$  we find it, since we can obtain at least  $(1 - \epsilon)$  of the optimal profit.

The solution we get is feasible for:

Dual'

$$\begin{array}{ll} \max & \sum_{i=1}^m y_i b_i \\ \text{s.t.} & \forall j \in \{1, \dots, N\} \quad \sum_{i=1}^m T_{ji} y_i \leq 1 + \epsilon' \\ & \forall i \in \{1, \dots, m\} \quad y_i \geq 0 \end{array}$$

Primal'

$$\begin{array}{ll} \min & (1 + \epsilon') \sum_{j=1}^N x_j \\ \text{s.t.} & \forall i \in \{1 \dots m\} \quad \sum_{j=1}^N T_{ji} x_j \geq b_i \\ & \forall j \in \{1, \dots, N\} \quad x_j \geq 0 \end{array}$$

## Separation Oracle

If the value of the computed dual solution (which may be infeasible) is  $z$  then

$$\text{OPT} \leq z \leq (1 + \epsilon')\text{OPT}$$

**How do we get good primal solution (not just the value)?**

- ▶ The constraints used when computing  $z$  **certify** that the solution is feasible for **DUAL'**.
- ▶ Suppose that we drop all unused constraints in **DUAL**. We will compute the same solution feasible for **DUAL'**.
- ▶ Let **DUAL''** be **DUAL** without unused constraints.
- ▶ The dual to **DUAL''** is **PRIMAL** where we ignore variables for which the corresponding dual constraint has not been used.
- ▶ The optimum value for **PRIMAL''** is at most  $(1 + \epsilon')\text{OPT}$ .
- ▶ We can compute the corresponding solution in polytime.

This gives that overall we need at most

$$(1 + \epsilon') \text{OPT}_{\text{LP}}(I) + \mathcal{O}(\log^2(\text{SIZE}(I)))$$

bins.

We can choose  $\epsilon' = \frac{1}{\text{OPT}}$  as  $\text{OPT} \leq \# \text{items}$  and since we have a **fully polynomial time approximation scheme (FPTAS)** for knapsack.
